**Client:** Sample business

**Website analyzed:** <https://www.sample-business.com/>

**Date:** 10/07/2026

**Type of check:** External, non-invasive analysis

**Prepared by:** Juri

## 1. Plain-language summary

This public sample shows the format of the check-up: a short, concrete report that anyone can read, even someone who doesn't look after the website day to day. In this case the site presents the business fairly clearly, but on a phone some text is hard to read and it isn't immediately obvious how to get in touch; there are also a few simple technical settings worth having your web developer check.

In short: the goal isn't to prove a website is "secure" or "compliant", but to show, in practical order, what is worth fixing first so you don't lose trust, readability and inquiries.

## 2. Priority table

| Problem                                       | Impact                                                                        | Priority | Who fixes it                      |
|-----------------------------------------------|-------------------------------------------------------------------------------|----------|-----------------------------------|
| Secondary text hard to read on a phone        | Some visitors struggle to read useful descriptions and details                | High     | Your web developer                |
| It isn't clear how to get in touch            | Some visitors don't immediately see whether to call, write or ask for a quote | Medium   | Owner and web developer           |
| Page title and Google description too generic | The site stands out little in search results                                  | Medium   | Owner and web developer           |
| Some basic server protections are missing     | The site is less protected than it should be, though it isn't an emergency    | Low      | Web developer or hosting provider |

### Priority overview

## 3. Main points

## Point 1 - Secondary text hard to read on a phone

### What I saw

The homepage works on a phone, but some descriptions and secondary text are small and low in contrast against the background.

### Why it matters

Many visitors arrive on a smartphone and decide within seconds whether to stay: if the text is hard to read, the offer comes across less clearly.

### What to do

Increase the contrast, size and spacing of secondary text in the most important sections, then check the homepage again on a real phone.

### Who fixes it

Your web developer

## Point 2 - It isn't clear how to get in touch

### What I saw

The site presents the business well, but there is no clear call to action, for example a "Call us" or "Request a quote" button: visitors have to work out for themselves what to do.

### Why it matters

When the invitation to get in touch isn't explicit, some visits stay passive and never become an inquiry.

### What to do

Replace the generic invitation with a precise one (for example "Request a free quote") and repeat it at the key points of the page, with the phone number and form easy to find.

### Who fixes it

The owner for the wording, the web developer for placement and design

## Point 3 - Page title and Google description too generic

### What I saw

The page title, the one shown on Google and in the browser tab, says little about the service and location. The meta description, the short text shown under the title in search results, doesn't make people want to click either.

### Why it matters

A site that presents itself well on Google starts with an advantage: it helps people choose you before the page even opens.

### What to do

Rewrite the homepage title and description with the business, the area and the main benefit, in a simple tone.

### Who fixes it

The owner for the text, the web developer for the update

## Point 4 - Some basic server protections are missing

### What I saw

The external check shows that some security settings the server can send to the browser along with the page (headers) are missing, such as X-Content-Type-Options and Referrer-Policy.

### Why it matters

It isn't an emergency, but it is a setup that could be improved on a site that needs to come across as reliable.

### What to do

Ask your web developer or hosting provider to enable these settings on the server, without touching the rest of the site.

### Who fixes it

Your web developer or hosting provider

## 4. Quick fixes

1. Increase the contrast and readability of secondary text on the homepage on phones.
2. Make the main button to call or request a quote more visible.
3. Have your web developer enable the basic server protections.

## 5. Essential technical appendix

| Check                        | Result in brief                                               | Who acts                          |
|------------------------------|---------------------------------------------------------------|-----------------------------------|
| Homepage on a phone          | Works, but secondary text is hard to read                     | Web developer                     |
| Contact                      | Present, but the invitation to get in touch should be clearer | Owner and web developer           |
| HTTPS                        | Active, no warnings                                           | No urgency                        |
| Title and Google description | Should be more specific                                       | Owner and web developer           |
| Security headers             | A few basic ones are missing                                  | Web developer or hosting provider |

## 6. Glossary

Technical words used in this report, briefly explained.

- **Call to action:** the button or phrase that tells visitors what to do, for example "Call us" or "Request a quote". Often shortened to CTA.
- **Headers:** technical information the server sends to the browser along with the page; some of it protects visitors.
- **Hosting:** the service that keeps the site running on a server and reachable on the internet.
- **HTTPS:** the protected version of a web address, the one with the padlock: data between visitor and site is encrypted.
- **Meta description:** the short text Google shows under the site's title in search results.
- **Page title:** the text shown in the browser tab and as the clickable headline on Google.
- **Server:** the always-on computer the site is hosted on.
- **Web developer:** the person or agency that builds and updates the site.

## 7. Final note

---

This report is anonymized and does not describe a real business. It only shows the format of the document the client receives and the level of clarity.
